Ducting kits install manual

1. Make sure your Cooker Hood is disconnected from its Power Source.
2. Carefully measure and mark out a Ø155mm area in your ceiling or wall.
    a) Most of the time this will be directly above your cooker hood, in line with the outlet on the extractor fan.
    b) If you have a Chimney Cooker Hood, the Hole and Ducting Pipe should be covered by the Chimney after installation.
    c) The shorter the ducting and the fewer the number of bends, the better your extraction rate will be.
3. Drill a Ø155mm hole.
4. Place the External Vent over the hole on the External Wall and make sure the blades are facing downwards so that they lie flat.
5. Mark out and Drill 4 x Ø3.0mm holes in the Wall for securing the External Vent using Screws.
6. Attach the Vent securely to the wall and using 1 x Cable Tie secure the Ducting Pipe in place.
7. Finally attach the other end of the Ducting Pipe to the Cooker Hood Outlet using 1 x Cable Tie.
